It supports the 16.2 megapixel Nikon D800, ƒ/1.8 lens. In addition, it's compatible with Nikon's Basic Photo Panel ƒ/2.8 G lens. I have been using Photoshop since CS3, and am currently using 5.0. On the whole, the UI, functionality and speed are good. One thing I noticed was that the recently-uploaded (using iCloud sync) images were being set to saved/draft mode, and that when I went to access them, they were no longer updated. After a lot of work on my end, I managed to make this image saved. I am wondering if this is a bug or preset, as I recall from version 4 (CS2) that setting recently-submitted (loaded from the cloud upload) photos to saved mode would make them inaccessible.

What It Does: When working on large projects, there may be times when you need to break up different parts of your image into separate files (or layers). There are many reasons why you should do this. You can use the Move tool to quickly switch to and from other parts of your image without losing your position in the timeline. You may want to split off a background layer that contains, perhaps, the text or elements that you've already added to your image. Layer names are also useful when you need to rename an object to create a more organized workflow. In the prior version of Photoshop CS4, I used to switch between Photoshop and Bridge most of the time for compatibility with Photoshop's filetype of PSD. If you have a PSD file, you are able to open it in Photoshop. But there may come a time when you have to switch to Bridge. Bridge is a tool that Adobe has started to emerge in recent releases. With Bridge you are able to edit your images in the browser, laying the groundwork for a future when using the web means editing your images in the browser. Photoshop files have traditionally been PSD files. However, in recent versions of Photoshop, Photoshop has implemented its own proprietary file format, called PSDx, which has sparked a bit of debate around how to separate Photoshop from the PSD format. In 2004, Adobe acquired a company named Interarchy developed a custom web browser, called Cacoon, using the Adobe Flash Player. Cacoon ran on Windows and was integrated into Adobe's Photoshop CS4 software. Cacoon's idea was to break the "one app, one solution" restrictions of the desktop PC. 933d7f57e6
